Torque is the twisting power of an engine, and of course a prop needs torque. This is especially true for larger, heavier boats. A diesel engine puts out more torque than a petrol one. Therefore, the heavier the boat, the stronger the argument for diesel compared to petrol. So – let ' s answer the question we asked at the beginning.

Boats are used less frequently and in a sailboat the engine is used even less as the primary method of propulsion are the sails and the wind. It is not uncommon to find 30 year old engines in very good shape. The use of a marine engine is measured in hours and a diesel engine can easily go 10,000 hours before requiring a rebuild.

**eccentric** placed on the camshaft with suitable rods between it and the rocker arms of both air inlet and exhaust valves. This is a similar arrangement to that shown with the 2 cycle valve motion at Fig. 50. The side shaft is geared again to a crossshaft placed behind the cylinder which is furnished to operate the fuel injection valve. The air compressor for furnishing high pressure injection air is driven from the outer end of the crankshaft and is attached to the bedplate in the single cylinder engine; in the multi-cylinder type it is placed separately on the foundation. Lubrication is supplied to all bearings by a feed pump placed in the compressor crankcase which elevates the lubricant to a receptacle placed

above the crank cover, whence it flows to each bearing. This oil is filtered and used continuously.

The piston is lubricated by a force feed pump in the usual way. In the double cylinder engine of this type the frame is cast in one piece; the valve motion consisting of eccentric and push rods is similar to that already described, only that they are extended to the valves of the second cylinder, and the crossshaft operating the fuel injection valve is also extended (see Fig. 53). In the 4 cylinder engine of the 4 cycle type two sets of two cylinders are placed side...
