This indispensable book describes lubricant additives, their synthesis, chemistry, and mode of action. All important areas of application are covered, detailing which lubricants are needed for a particular application. Laboratory and field performance data for each application is provided and the design of cost-effective, environmentally friendly technologies is fully explored. This edition includes new chapters on chlorohydrocarbons, foaming chemistry and physics, antifoams for nonaqueous lubricants, hydrogenated styrene–diene viscosity modifiers, alkylated aromatics, and the impact of REACH and GHS on the lubricant industry.

This text details the design of cost-effective, environmentally friendly lubricant additive technologies and components for the automotive, industrial, manufacturing, food, and aerospace industries. Presenting methods to improve the performance and stability of lubricants, protect metal surfaces against wear, and to control deposits and contaminant

The interaction of high detergent oils with fine filtration materials is examined. It was found that surface tension can serve as a measure of the concentration of additives in lubricating oils. A unique relationship exists between the surface tension and the detergent properties of oils containing different concentrations of SB-3 additive. The process of absorption on oil filter elements is physical in nature. A formula was derived which permits quantitative evaluation of the amount of absorption of additive in the 28-138 degrees C temperature interval for circulation time of oil in the system from 5-20 hr. The second part of the article deals with the continuous delivery of additives to motor oils. A laboratory device was constructed which permits delivery of oil additive to the oil while the engine is operating.
