For heat treatment of steels, the first resource to become familiar with is the iron–cementite equilibrium phase diagram, which shows the equilibrium phases in iron–carbon alloys for a given temperature and composition. The iron–carbon equilibrium phase diagram (10) presented in Figure 1 shows carbon levels up to 7 wt.%, but steels are iron–carbon alloys only up to approximately 2 wt.%, which is the limit of carbon solubility in austenite.

## ~~8 Types of Heat Treatment Processes and Their Purposes ...~~

Carburization:- Carburization is a heat treatment process in which steel or iron is heated to a temperature, below the melting point, in the presence of a liquid, solid, or gaseous material which decomposes so as to release carbon when heated to the temperature used.

## ~~Heat Treatment Of Steel—Tempering, Hardening, Normalizing ...~~

Hardening is a heat treatment process carried out to increase the hardness of Steel. It consists of heating Steel components to the temperature within or above its critical range. Held at this temperature for a considerable time to ensure thorough penetration of heat at this temperature well inside the component and then allowed to cool separately by quenching in water oil or brine solution.

## ~~Heat Treatment—Annealing, Normalizing, Hardening ...~~

Steel heat treating practice rarely involves the use of temperatures above 1040 C (1900 F). In metal systems, pressure is usually considered as constant. Frequent reference is made to the iron-cementite diagram (Fig. 4) in this chapter and throughout this book. Consequently, understanding of this concept and diagram is essential to further discussion.

## ~~Fundamentals of the Heat Treating of Steel~~

Since all steels will pass through the single-phase austenite ( $\gamma$ , gamma) region and the heat treatment of steel is concerned with the conversion of  $\gamma$  to other phases at lower temperature, ignoring the  $\gamma$ -iron isn't too serious.

Annealing is the softening of metal by heat treatment. Ferrous metals are annealed by heating to just above the A3 point (a point above non-magnetic that varies with the carbon content), and then cooling slowly. For common carbon steels the cooling can be done in dry ashes, lime powder or vermiculite.

## ~~Heat Treating Steel—Hardening and Tempering ...~~

Heat treatment of steels is the heating and cooling of metals to change their physical and mechanical properties, without letting it change its shape. Heat treatment could be said to be a method for strengthening materials but could also be used to alter some mechanical properties such as improving formability, machining, etc.

Heat Treatment Of Steels As An Art To Improve Their Service Performance Has Been Practised Ever Since It Started To Be Used As Tools And Weapons. However, The Scientific Basis Of Heat Treatment Of Steels Became More Apparent Only In The First Half Of This Century And Still Some Gaps Remain In Its Complete Understanding. Earlier Books On Heat Treatment Of Steels Mainly Emphasised The Art And The Empirically Arrived Principles Of Heat Treatment. In The Last Few Decades, Our Understanding Of Phase Transformations And Mechanical Behaviour Of Steels, And Consequently Of Heat Treatment Of Steels, Has Considerably Increased. In This Book On Principles Of Heat Treatment Of Steels The Emphasis Is On The Scientific Principles Behind The Various Heat Treatment Processes Of Steels. Though It Is Expected That The Reader Has Sufficient Background In Phase Transformations And Mechanical Behaviour Of Materials, First Few Chapters Review These Topics With Specific Reference To Steels. Basic Principles Of Various Heat Treatment Processes Of Steels Including Surface Hardening Processes, Are Then Covered In Sufficient Detail To Give A Good Overall Understanding Of These Processes. The Detail Engineering Aspects Are, However, Omitted. These Are Easily Available In Various Handbooks On Heat Treatment. The Book Also Covers Heat Treatment Of Tool Steels And Cast Irons. The Book Has Been Well Written And Can Be Used A Textbook On Heat Treatment For Undergraduate Students. Excerpt from Heat-Treatment of Steel: A Comprehensive Treatise on the Hardening, Tempering, Annealing and Casehardening of Various Kinds of Steel, Including High-Speed, High-Carbon, Alloy and Low-Carbon Steels, Together With Chapters on Heat-Treating Furnaces and on Hardness Testing In the development that has taken place in the methods and processes pertaining to the machine building trades during the past fifteen or twenty years, most remarkable changes have been wrought in the heat-treatment of steel, including the hardening, tempering, annealing and casehardening of the various kinds of steels. The introduction of high-speed steel and of the various alloy steels has especially demanded great modifications of past practice. The present book places on record the modern methods now employed in the heat-treatment of steel, and includes also a treatise on the methods used for measuring the hardness of metals by the various hardness testing apparatus that have been developed in this country and abroad. Special attention has been given to a number of methods very recently developed, making this book the most modern and complete on the subject; thus, for example, a very comprehensive treatment is given of electric hardening furnaces, a development unknown only a few years ago. Another of the more recent developments to which attention has been given is the method of casehardening by carbonaceous gas which has been developed very recently.
