To understand hydrochemistry and to analyze natural as well as man-made impacts on aquatic systems, hydrogeochemical models have been used since the 1960 ' s and more frequently in recent times. Numerical groundwater flow, transport, and geochemical models are important tools besides classical deterministic and analytical approaches. Solving complex linear or non-linear systems of equations, commonly with hundreds of unknown parameters, is a routine task for a PC. Modeling hydrogeochemical processes requires a detailed and accurate water analysis, as well as thermodynamic and kinetic data as input. Thermodynamic data, such as complex formation constants and solubility-products, are often provided as databases within the respective programs. However, the description of surface-controlled reactions (sorption, cation exchange, surface complexation) and kinetically controlled reactions requires additional input data. Unlike groundwater flow and transport models, thermodynamic models, in principal, do not need any calibration. However, considering surface-controlled or kinetically controlled reaction models might be subject to calibration. Typical problems for the application of geochemical models are:

- speciation
- determination of saturation indices
- adjustment of equilibria/disequilibria for minerals or gases
- mixing of different waters
- modeling the effects of temperature
- stoichiometric reactions (e.g. titration)
- reactions with solids, fluids, and gaseous phases (in open and closed systems)
- sorption (cation exchange, surface complexation)
- inverse modeling
- kinetically controlled reactions
- reactive transport

Hydrogeochemical models depend on the quality of the chemical analysis, the boundary conditions presumed by the program, theoretical concepts (e.g.

While most books approach power electronics and renewable energy as two separate subjects, Power Electronics for Renewable and Distributed Energy Systems takes an integrative approach; discussing power electronic converters topologies, controls and integration that are specific to the renewable and distributed energy system applications. An overview of power electronic technologies is followed by the introduction of various renewable and distributed energy resources that includes photovoltaics, wind, small hydroelectric, fuel cells, microturbines and variable speed generation. Energy storage systems such as battery and fast response storage systems are discussed along with application-specific examples. After setting forth the fundamentals, the chapters focus on more complex topics such as modular power electronics, microgrids and smart grids for integrating renewable and distributed energy. Emerging topics such as advanced electric vehicles and distributed control paradigm for power system control are discussed in the last two chapters. With contributions from subject matter experts, the diagrams and detailed examples provided in each chapter make Power Electronics for Renewable and Distributed Energy Systems a sourcebook for electrical engineers and consultants working to deploy various renewable and distributed energy systems and can serve as a comprehensive guide for the upper-level undergraduates and graduate students across the globe.

This book is the first to tackle the difficult and complex politics of transition in Zimbabwe, with deep historical analysis. Its focus is on a very problematic political culture that is proving very hard to transcend. At the center of this culture is an unstable but resilient ' nationalist-military ' alliance crafted during the anti-colonial liberation struggle in the 1970s. Inevitably, violence, misogyny and masculinity are constitutive of the political culture. Economically speaking, the culture is that of a bureaucratic, parasitic, primitive accumulation and corruption, which include invasion and emptying of state coffers by a self-styled ' Chimurenga aristocracy. ' However, this Chimurenga aristocracy is not cohesive, as the politics that led to Robert Mugabe ' s ousting from power was preceded by dirty and protracted internal factionalism. At the center of the factional politics was the ' first family ' :Robert Mugabe and his wife, Grace Mugabe. This book offers a multidisciplinary examination of the complex contemporary politics in Zimbabwe, taking seriously such issues as gender, misogyny, militarism, violence, media, identity, modes of accumulation, the ethnicization of politics, attempts to open lines of credit and FDI, national healing, and the national question as key variables not only of a complete political culture but also of difficult transitional politics.

The tiers are shifting. The omniverses are under attack. And only one man has the chromosomes to make things right. Or does he? Filthy Frank begins life as the harmless creator of extinction level radioactive weapons, but is taken far into the deepest recesses of the omniverses to learn how everything came to be and how everything will be. If it were only that simple. He and his group of deviant disciples are chased from realm to realm by murderous chimpillas and treacherous peace lords, as he seeks to understand the dark secrets of the omniverses. An encounter with the Ultimate God might be his only chance, but Frank must first survive not only those who fight for evil but his own struggle for good as well. If only his chromosomes would stop multiplying...
