Ammonium perchlorate ("AP") is an inorganic compound with the formula NH_4ClO_4 . It is a colorless or white solid that is soluble in water. It is a powerful oxidizer. Combined with a fuel, it can be used as a rocket propellant. Its instability has involved it in a number of accidents, such as the PEPCON disaster.

The structural and morphological properties of the chromate nanoparticles were characterized by X-ray diffraction (XRD) and a scanning electron microscope (SEM). The catalytic effects of chromates on the thermal decomposition of fine ammonium perchlorate (FAP) and hexanitrohexaazaisowurtzitan e (CL-20) were studied by the TG-DTG measurements.

Preparation of ammonium perchlorate by double decomposition of ammonium sulfate and sodium perchlorate was used to determine a target price for economic production.

The patent concerns a method for preparing uniform well-defined ammonium perchlorate crystals of controlled size which comprises dissolving ammonium perchlorate in an organic solvent and then precipitating in a mixture of an organic solvent and non-solvent for ammonium perchlorate.
