Percent of element by mass = $\frac{\text{mass of element in 1 mole compound}}{\text{mass of one mole compound}} \times 100$. Example: Find percent compositions of elements in $C_6H_{12}O_6$. (C=12, H=1, O=16) Percent of C by mass = $\frac{\text{mass of C in one mole compound}}{\text{mass of one mole compound}} \times 100$. C % = $100 \times \frac{72}{180}$.

Provides a broad overview of the principles of chemistry, the reactivity of chemical elements and their compounds, and the applications of chemistry. Conveys a sense of chemistry as a field that not only has a lively history but also one that is currently dynamic, with important new developments on the horizon.

This tutorial provides the application of the coupling interface OGS#IPhreeqc (open-source scientific software) to model reactive mass transport processes in environmental subsurface systems. It contains general information regarding reactive transport modeling and step-by-step model set-up with OGS#IPhreeqc and related components such as GINA and ParaView. Benchmark examples (1D to 2D) are presented in detail. The book is intended primarily for graduate students and applied scientists who deal with reactive transport modeling. It also gives valuable information to the professional geoscientists wishing to advance their knowledge in numerical simulation, with the focus on the fate and transport of nitrate. It is the third volume in a series that represents the further application of computational modeling in hydrological science.

Details the many benefits of applying mass spectrometry to supramolecular chemistry. Except as a method for the most basic measurements, mass spectrometry (MS) has long been considered incompatible with supramolecular chemistry. Yet, with today's methods, the disconnect between these two fields is not warranted. *Mass Spectrometry and Gas-Phase Chemistry of Non-Covalent Complexes* provides a convincing look at how modern MS techniques offer supramolecular chemists a powerful investigatory toolset. Bringing the two fields together in an interdisciplinary manner, this reference details the many different topics associated with the study of non-covalent complexes in the gas phase. The text begins with brief introductions to supramolecular chemistry and such relevant mass spectrometric methods as ionization techniques, analyzers, and tandem MS experiments. The coverage continues with: How the analyte's transition into the gas phase changes covalent bonding; How limitations and pitfalls in analytical methods may produce data misinterpretations; Artificial supramolecular aggregates and their examination; Biomolecules, their complexes, and their examination. After the general remarks making up the first section of the book, the following sections describe specific experimental procedures and are illustrated with numerous examples and short tutorials. Detailed citations end each chapter. Mass spectrometrists, supramolecular chemists, students in these fields, and interested readers from other disciplines involving the study of non-covalent bonds will all value *Mass Spectrometry and Gas-Phase Chemistry of Non-Covalent Complexes* as an innovative and practical resource.
