World Energy Outlook 2018: Launch Presentation World Energy Outlook 2017 lea

Four large-scale shifts in the global energy system set the scene for the World Energy Outlook 2017: the rapid deployment and falling costs of clean energy technologies, the growing electrification of energy, the shift to a more services-oriented economy and a cleaner energy mix in China, and the resilience of shale gas and tight oil in the United States.

The ten Association of Southeast Asian Nations (ASEAN) countries are among the most dynamic parts of the global energy system and a rising force in international energy affairs. Thanks to its growing partnership with Southeast Asia, the International Energy Agency (IEA) has conducted regular in-depth studies of the energy challenges facing this region. This new report, which was prepared as part of the IEA's flagship World Energy Outlook series, provides insights for policy makers, industry and other energy stakeholders to help address the energy sector challenges facing Southeast Asia today. The report highlights: The state of play across the Southeast Asia's energy sector, based on the latest data and

The opportunities that broader changes in global markets and low-carbon technologies open up for Southeast Asia. The investment required to improve efficiency and expand energy supply infrastructure, especially in the electricity sector. The mix of fuels and technologies that can help Southeast Asia achieve universal electricity access. An alternative pathway, the Sustainable Development Scenario, to meet energy security and environmental goals.

193 countries, included for the first time a target to ensure affordable, reliable, sustainable and modern energy for all, underscoring a new level of political agreement on the importance of access to modern energy services. At the same time, the declining cost of decentralised renewables, increased access to affordable energyefficient appliances and the use of mobile platforms are changing the way we think about providing energy access. It is against this backdrop that the IEA produced this Special Report, part of its flagship World Energy Outlook (WEO) series. This report: Expands and updates the WEO's country-by-country electricity and clean cooking access database, and assesses the status for all developing countries, reviewing recent trends and policy efforts up to 2016. Presents a global and regional electricity

Provides a pathway for achieving access to modern energy for all by 2030, identifying policy priorities, detailing investment needs, and the role that decentralised and on-grid solutions may play. Analyses how energy development can unleash economic growth in sectors such as agriculture, and explores how energy access intersects with other issues such as gender, health and climate change.

Industry and government decision-makers and others with a stake in the energy sector all need WEO-2012. It presents authoritative projections of energy trends through to 2035 and insights into what they mean for energy security,

"The climate and energy crisis requires a strong state to change the direction, speed and scale of innovation in world capitalism in order to create a bio-digital energy paradigm. Four states are possible contenders for catalyzing this survival governance; China, the EU, India and the US. China is an improbable leader, but less improbable than the other three. No US President can close down the fossil fuel industry in time. The US state, worried about the slippage of its technological superiority, is turning to regulatory mechanisms

like intellectual property to slow China's technological development. China will have to manage the risk of a US bent on military primacy. China is urbanizing innovation on a historically unprecedented scale. Lying at the heart of the bio-digital energy paradigm is a global city-based network of innovation. China, more than the other three states, is scaling technology innovation through the building of experimental cities such as eco-cities, hydrogen cities, forest cities, and sponge cities. The Belt and Road initiative will take this innovation well outside of China's borders. China could help to place cities into a new relationship with their surrounding ecosystems. Drawing on more than 250 interviews, carried out in 17 countries, including the world's largest four carbon emitters, the book shows how cities and their networks

This book addresses the question: how effective are countries in promoting the innovation needed to facilitate an energy transition? At the heart of the book is a set of empirical case studies covering supply and demand side technologies at different levels of maturity in a variety of countries. The case studies are set within an analytical framework encompassing the functions of technological innovation systems and innovation metrics. The book concludes with lessons and recommendations for effective policy intervention.

introduces the reader to a suite of potential policy pathways to the necessary transformation in societal energy consumption, usage and behavior. Solutions discussed include energy efficiency, energy security, the role of political leadership, green public policy, and the transition to renewable energy sources. International contributions address the range and depth of current research from a position of advocacy for 'energy stewardship' as the driver of this transformation. Case studies illustrate the range of various countries to diminish energy use. Finally, policy avenues are covered in depth. This book will show that when some countries begin using oil and gas as an instrument of exerting pressure and to realize political goals, energy security becomes synonymous with national security as well as economic security. It is within this context that the Nordic countries serve as role models and an exemplification of modern, innovative and ecofriendly solutions. This book highlights that the Nordic countries represent a very broad spectrum of competencies and techniques in the field of making use of various energy

Starting with the fundamentals of the global energy industry, Handbook of Energy Politics goes on to cover the evolution of capital and financial markets in the energy industry, the effects of technology, environmental issues and global warming and geopolitics. The book concludes by considering the future, including the lessons learned from history, where we are most likely to be heading and what steps we can take to mitigate potential energy risks. This Handbook will be an invaluable resource for upper level graduates and postgraduate scholars.
